Abstract

Financial institutions face increasing challenges in identifying high-risk customers, predicting loan defaults, and detecting fraudulent transactions due to the growing volume of financial data. Traditional risk assessment methods are often time-consuming and less effective in handling complex financial patterns.

This project, "Enhancing Financial Risk Management Through Machine Learning Analytics," proposes a data-driven approach to improve financial risk assessment using Machine Learning techniques. The system collects and preprocesses financial data, performs exploratory data analysis and feature engineering, and trains Machine Learning models to predict customer financial risk.

Based on customer information such as income, credit history, loan details, and transaction behaviour, the model classifies customers into Low, Medium, or High Risk categories and generates a risk score to support decision-making. By enabling accurate and timely risk prediction, the proposed system helps financial institutions reduce loan defaults, detect potential fraud, improve credit assessment, and enhance overall financial stability. This project demonstrates how Machine Learning Analytics can support smarter, faster, and more reliable financial risk management.
